

Chose to connect PWM power supplies to VDD and GND because they may need high current  
 Chose to connect digital power to VDDA and VSSA because those are what the STM32's digital power supplies are connected to  
 Added extra 1uF decoupling capacitors to PWM power ports because they may need high current  
 Decided to use STM32's SPI1 (PA4-7) to communicate with MCU  
 Connected SSB to PB1  
 Connected RDY/BSYB to PB2  
 Connected INTB to PB4  
 Chose not to connect XCLK, as: "The ISD2360 requires no external clock sources or components except a speaker"
